1.2 General information

This document serves as a reference to the design works of products that will be manufactured by UMC using the following process.

0.11 um Logic and Mixed-Mode 1P8M Metal Metal Capacitor AI Advanced Enhancement Process

For more information about this process and technology, please see the electrical design rule listed below.

G-02-LOGIC/MIXED_MODE11-1P8M-MMC/AL/L110AE-EDR

The creation, verification, and usage of the compact model of the following device is presented in this document.

1.2V n-ch MOSFET

The following compact model is chosen for the modeling of these devices.

BSIM3V3.24

For detailed descriptions of this compact model equations and parameters, please refer to this material.

BSIM3V3.24 MOSFET Model User Manual

In BSIM3V3.24, there are two types of models that could be used. One is binning model, which means the whole device dimension range is chopped into several "bins" and different model parameter sets are provided for each bin. The other one is global model, which means one scalable parameter set is provided and it could cover the whole device geometry range. Each of these two approaches has advantages over the other.

UMC provides global models for its many benefits and the model accuracy is guaranteed by a quantitative report of model fitting error against the hardware data, which can be found in the following sections.

1.3 Model usage

The compact model is provided in various formats. It's guaranteed that the simulation results of this model from different simulators show differences less than 0.5% and 1% for DC and AC simulations respectively. It should be noted that the model has been verified on different simulators of the specific versions listed below and the simulation results from other versions of simulator might be different.

Synopsys HSPICE release 2012.06
Cadence Spectre version 10.1.1.111.isr8
Mentor Graphics Eldo version 6.11_1.1

To cope with the impact of process variations on circuit performance, worst-case models are provided along with the typical case and they are listed below. Please note that 'fast' here means lower threshold voltage, higher leakage and driving current, and 'slow' means higher threshold voltage, lower leakage and driving current.

TT: Typical n-ch MOSFET and Typical p-ch MOSFET
FF: Fast n-ch MOSFET and Fast p-ch MOSFET
SS: Slow n-ch MOSFET and Slow p-ch MOSFET

Follow these steps to invoke the model file during simulation.

For Synopsys HSPICE

- Copy ModelFileName.mdl and ModelFileName.lib into your simulation directory.
- Add the following statement in the input file to the simulator for 90% dimension shrinkage.
.Option scale=0.9

- Add the following statement in the input file to the simulator.
.lib "/ModelFileName.lib" CaseName
, where CaseName could be TT, FF, or SS

For Cadence Spectre

- Copy ModelFileName.mdl.scs and ModelFileName.lib.scs into your simulation directory.
- Add the following statement in the input file to the simulator for 90% dimension shrinkage.
.Option scale=0.9
- Add the following statement in the input file to the simulator.
include "/ModelFileName.lib.scs" section=CaseName
, where CaseName could be TT, FF, or SS

For Mentor Graphics Eldo

- Copy ModelFileName.mdl.eldo and ModelFileName.lib.eldo into your simulation directory.
- Add the following statement in the input file to the simulator for 90% dimension shrinkage.
.Option scale=0.9
- Add the following statement in the input file to the simulator.
.lib "/ModelFileName.lib.eldo53" CaseName
, where CaseName could be TT, FF, or SS
For 1.2V n-ch MOSFET: n_nvt_12_1110e

As stated above that one global model is provided and this model is valid within the following geometry, voltage, and temperature ranges. Device behavior beyond these ranges may not be well described by the model and is not guaranteed.

Geometry range:(After 90% shrink)

For 1.2V n-ch MOSFET:

$$1.08 \mu\text{m} \leq L_{\text{DES}} \leq 50 \mu\text{m}$$
$$0.9 \mu\text{m} \leq W_{\text{DES}} \leq 100 \mu\text{m}$$

Voltage range:

For 1.2V n-ch MOSFET:

$$0\text{V} \leq V_{\text{GS}} \leq 1.2\text{V} (*1.1)$$
$$0\text{V} \leq V_{\text{DS}} \leq 1.2\text{V} (*1.1)$$
$$-1.2\text{V} \leq V_{\text{BS}} \leq 0\text{V}$$

Temperature range:

For both 1.2V n-ch MOSFET:

$$-50\text{ }^{\circ}\text{C} \sim +125\text{ }^{\circ}\text{C}$$

UMC L110E is UMC L130E 90% direct shrunk option. The following table give users (including designers) a dimension correlation between Drawing vs. SPICE/Resistor dimensions.

2.3.4 Model fitting accuracy

The model fitting accuracy of parameters I_D , G_M and G_{DS} is quantified using the following equation:

$$\text{error \%} = 100 * | \text{measurement} - \text{simulation} | / [(\text{measurement} + \text{simulation}) / 2]$$

Different error criteria are defined for different parameters (I_D , G_M and G_{DS}) as well as for different operation region. These criteria are explained below.

1) I_D accuracy criteria

- a. I_D in sub-threshold region, i.e. $V_{GS} < V_T$
- b. I_D in moderate inversion region, i.e. $V_T \leq V_{GS} < V_T + V_X$
- c. I_D in strong inversion region, i.e. $V_T + V_X \leq V_{GS} \leq V_{CC}$

, where $V_X = (V_{CC} - V_T) / 2$, $V_{CC} = 1.2V$

2) G_M and G_{DS} accuracy criteria

- a. G_M and G_{DS} in sub-threshold region, i.e. $V_{GS} < V_T$
- b. G_M and G_{DS} in inversion region, i.e. $V_T \leq V_{GS} \leq V_{CC}$

Table 2-5 Requirement for model fit quality

Target of Quality Check	$V_{GS} < V_T$ (sub-threshold)	$V_T \leq V_{GS} < V_T + V_X$ (moderate inversion)	$V_T + V_X \leq V_{GS} \leq V_{CC}$ (strong inversion)
I_D	$\leq 75\%$	$\leq 25\%$	$\leq 7\%$

➤ *CJ, CJSW vs. VBIAS Plots*

The following plot shows the variation of bottom area junction and STI bounded sidewall at different bias voltage and temperatures.

Figure 2-21 Bottom area junction capacitance at -50 °C, 25 °C and 125 °C for NMOS

Figure 2-22 STI bounded sidewall junction capacitance at -50 °C, 25 °C and 125 °C for NMOS

➤ **DEVICE PERFORMANCE LOOK UP TABLE (SIMULATION RESULTS FROM HSPICE VER.05.3):**

** The model simulation results in the following tables have already reflected silicon data that is sizing channel length back for 12nm. It means: The EDR value of size W/L : 10um/1.2um would be the same as the model card simulation result in size of W/L : 9um/1.08um(After 90% shrink without 12nm sizing channel length back).
